

Continuation of Strategic Cooperation between the Two Leading Universities

Dear authors and readers!

This is another thematic issue of our journal, which examines the results of scientific research on the strategy of national, regional and sectoral development of Russia. This issue continues the tradition established last year of inviting scientists in the field of scientific interests, who have the most comprehensive and relevant research that corresponds to the editorial mission, policy and scientific directions of our journal, to develop an up-to-date agenda for the thematic issues of the publication.

To date, the editorial board has published two thematic issues of the magazine. The first examined the use of artificial intelligence (AI) technologies in the public sector, the second examined tools designed to implement the country's strategic development plans and measures to improve the quality of life of citizens through the prism of national projects initiated by President of the Russian Federation Vladimir Putin. The scientific leadership of this issue was headed by the Head of the Department of Economic and Financial Strategy at the Moscow State School of Economics. Lomonosov, a foreign member of the Russian Academy of Sciences, Academician Vladimir Kvint. Irina V. Novikova, Doctor of Economics, Professor of the Department of Economic and Financial Strategy of the Moscow School of Economics at Lomonosov Moscow State University, provided great assistance in this work.

The Presidential Academy in St. Petersburg has been cooperating with Lomonosov Moscow State University for more than 20 years. This cooperation began with the joint participation of our two leading scientific and educational institutions in Russia during the development and implementation of the Strategy for the Socio-economic Development of St. Petersburg, initially until 2030 (under the leadership of V.I. Matvienko), and then until 2035. Our joint activities continued under the leadership of Governors G.S. Poltavchenko and A.D. Beglov. This strategy until 2035 was the first regional strategy of Russia, approved in the form of a regional law adopted by the Legislative Assembly of St. Petersburg. The teams of our scientists effectively collaborated in the process of developing a Strategy for water supply and sanitation in St. Petersburg. And here you have the result of continuing our cooperation.

I hope that the research published in this issue will arouse well-deserved interest and find its application.

*V. A. Shamakhov,
Doctor of Economics
Chief Editor of the Journal «Administrative Consulting»*
